

# **INTEGRATED CHARGE CONTROLLER FOR LEAD-ACID BATTERIES**

Check for Samples : [bq24450](#)

## **FEATURES**

- **Regulates Both Voltage and Current During Charging**
- **Precision Temperature-Compensated Reference:**
  - **Maximizes Battery Capacity Over Temperature**
  - **Ensures Safety While Charging Over Temperature**
- **Optimum Control to Maximize Battery Capacity and Life**

- **Supports Different Configurations**
- **Minimum External Components**
- **Available in 16-Pin SOIC (DW)**

## **APPLICATIONS**

- **Emergency Lighting Systems**
- **Security and Alarm Systems**
- **Telecommunication Backup Power**
- **Uninterruptible Power Supplies**

## **DESCRIPTION**

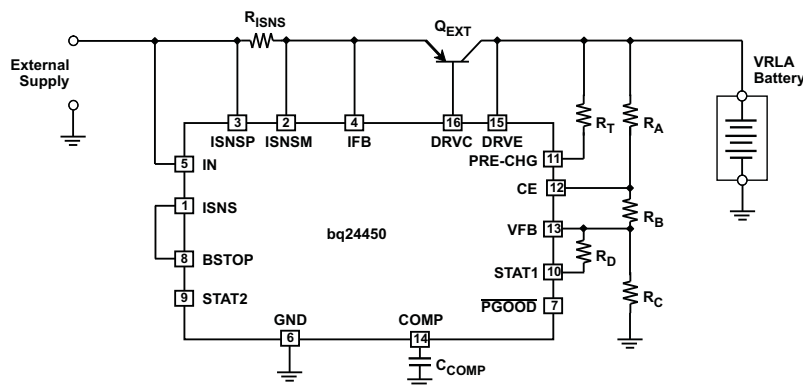

The bq24450 contains all the necessary circuitry to optimally control the charging of valve-regulated lead-acid batteries. The IC controls the charging current as well as the charging voltage to safely and efficiently charge the battery, maximizing battery capacity and life. Depending on the application, the IC can be configured as a simple constant-voltage float charge controller or a dual-voltage float-cum-boost charge controller.

The built-in precision voltage reference is especially temperature-compensated to track the characteristics of lead-acid cells, and maintains optimum charging voltage over an extended temperature range without using any external components. The IC's low current consumption allows for accurate temperature monitoring by minimizing self-heating effects.

The IC can support a wide range of battery capacities and charging currents, limited only by the selection of the external pass transistor. The versatile driver for the external pass transistor supports both NPN and PNP types and provides at least 25mA of base drive.

In addition to the voltage- and current-regulating amplifiers, the IC features comparators that monitor the charging voltage and current. These comparators feed into an internal state machine that sequences the charge cycle. Some of these comparator outputs are made available as status signals at external pins of the IC. These status and control pins can be connected to a processor, or they can be connected up in flexible ways for standalone applications.

## **TYPICAL APPLICATION SCHEMATIC**

A dual-level Float-cum-Boost Charger with Pre-Charge

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION

DEVICE PACKAGE	PACKING	ORDERABLE PART NUMBER	MARKING
SOIC (D)	Tube of 50	bq24450D	bq24450D
	Reel of 2500	bq24450DR	bq24450D

### ABSOLUTE MAXIMUM RATINGS<sup>(1) (2) (3)</sup>

over operating free-air temperature range (unless otherwise noted)

		VALUE	UNIT
Input Voltage	IN	–0.3 to 40	V
	PGOOD, STAT1, STAT2, ISNS	–0.3 to 40	V
	VFB, IFB, ISNSP, ISNSM	–0.3 to 40	V
	BSTOP	–0.3 to 40	V
Voltage	PRE-CHG (with respect to IN)	–32	V
Input Current	ISNS	80	mA
	STAT1, STAT2, PGOOD	20	mA
Output Current	PRE-CHG	–40	mA
Input Current	DRVC	80	mA
Output Current	DRVE	–80	mA
Power Dissipation at $T_A = 25^\circ\text{C}$		1000	mW
Junction temperature, $T_J$		–40 to 150	$^\circ\text{C}$
Storage temperature, $T_{STG}$		–65 to 150	$^\circ\text{C}$

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the ground terminal (pin 6) unless otherwise noted.
- (3) Positive currents are into, and negative currents out of, the specified terminal.

### RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNITS
$V_{IN}$	IN voltage range	5	40	V
$I_{STAT1}, I_{STAT2}, I_{PGOOD}$	Input current, open-collector status pins		5	mA
$I_{ISNS}$	Input current, open-collector ISNS comparator output		25	mA
$T_J$	Junction Temperature	–40	70	$^\circ\text{C}$

## ELECTRICAL CHARACTERISTICS

Over junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq 70^{\circ}\text{C}$ ,  $V_{IN} = 10\text{V}$ ,  $T_J = T_A$ . (Positive currents are into, and negative currents out of, the specified terminal)

## PIN FUNCTIONS

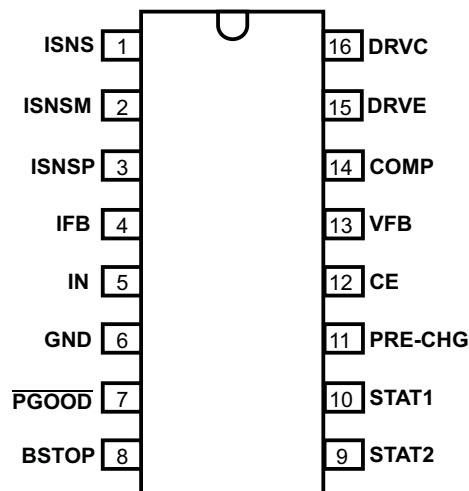

PIN		I/O	DESCRIPTION
NO.	NAME		
1	ISNS	O	Output of the current-sense comparator. Open-Collector.
2	ISNSM	I	Negative input of the current-sense comparator.
3	ISNSP	I	Positive input of the current-sense comparator.
4	IFB	I	Input for the current-regulating loop. External resistor between IN and IFB sets the charging current value.
5	IN	I	Supply voltage pin. Connect to external DC source.
6	GND	–	Ground terminal.
7	PGOOD	O	Open-collector output, indicates supply status at IN pin. Active low.
8	BSTOP	I	Control input. Taking this pin from low to high transitions the charger from Boost Mode to Float Mode. Internally pulled up through a 10µA current source.
9	STAT2	O	Open-collector status outputs. See table below.
10	STAT1	O	
11	PRE-CHG	O	Can be used to trickle-charge the battery till its voltage rises to a safe value. PRE-CHG will source current as long as the control voltage on the CE pin is below VREF. If using, connect to battery pack through external resistor.
12	CE	I	Charge enable control. If the voltage on the CE pin is below VREF, the driver transistor will be off and the PRE-CHG pin will source current.
13	VFB	I	Voltage feedback pin. Connect to battery through external resistive divider.
14	COMP	I/O	Compensation terminal for voltage loop. Connect a capacitor from this pin to GND.
15	DRVE	O	Emitter of the internal (NPN) driver transistor.
16	DRVC	I	Collector of the internal (NPN) driver transistor.

## TYPICAL OPERATING PERFORMANCE

Figure 2. -

## DETAILED FUNCTIONAL DESCRIPTION

The bq24450 contains all the necessary circuitry to optimally control the charging of sealed lead-acid batteries. The IC controls the charging current as well as the charging voltage to safely and efficiently charge the battery, maximizing battery capacity and life. Depending on the application, the IC can be configured in various ways: examples are a constant-voltage float charger, a dual-voltage float-cum-boost charger or a dual step current charger.

Only an external pass transistor and minimum number of external passive components are required along with the IC to implement a charger for sealed lead-acid batteries. The IC's internal driver transistor Q1 (see [Figure 1](#)) supports NPN as well as PNP pass transistors, and provides enough drive current (25mA specified) to support a wide range of charging rates.

The driver transistor is controlled by a voltage regulating loop and a current limiting-limiting loop (see [Figure 1](#)). The current-limiting loop reduces drive when the voltage between the IN pin and the IFB pin increases towards  $V_{ILIM}$  (250mV typical). The voltage regulating loop tries to maintain the voltage on the VFB pin at  $V_{REF}$ . Together, these two loops constitute a current-limited precision constant-voltage system, which is the heart of any lead-acid charger. The voltage regulating amplifier needs an external compensation circuit which depends on the type of external pass transistor (see Application Information section).

An important feature of the bq24450 is the precision reference voltage. The reference voltage is specially temperature compensated to track the temperature characteristics of lead-acid cells. Additionally, the IC operates with low supply current, only 1.6mA, minimizing on-chip dissipation and permitting the accurate sensing of the operating environmental temperature by avoiding self-heating effects. To take full advantage of the temperature-compensated reference, the IC should be in the same thermal environment as the battery.

An undervoltage lock-out circuit is also provided (see [Figure 1](#)). This circuit disables the driver transistor as long as the input voltage is below UVLO (4.5V typical). The UVLO circuit also drives an open-collector output PGOOD.

Voltage-sense and current-sense comparators are available in the IC. The current-sense comparator is uncommitted. Its open-collector output is OFF when the difference between the ISNSP and ISNSM pins is less than  $V_{ISNS}$  (25mV typical), and ON when the difference is more than  $V_{ISNS}$ . Depending on the application, this comparator may be used to switch to float charging after the boost phase is over. The voltage sense comparator can be used to sense the voltage level of the battery to initiate a new charge cycle.

Latches L1 and L2 constitute a state-machine to control the charging sequence. The internal inputs to the state-machine come from the UVLO circuit and the voltage-sense comparator. One external input is provided, the BSTOP pin. The outputs of the L1 and L2 latches are available at the STAT1 and STAT2 pins. The BSTOP pin is internally pulled up through a 10μA current source. The states of the state-machine are:

Q(L1)	Q(L2)	STAT1	STAT2	Condition	State #
LOW	HIGH	ON	OFF	Bulk Charge	State 1
LOW	LOW	ON	ON	Boost Mode	State 2
HIGH	HIGH	OFF	OFF	Float Mode	State 3

A small bias current source is available at the PRE-CHG pin to provide pre-charge to deeply discharged batteries. The PRE-CHG pin sources current when the voltage at the CE pin is below  $V_{REF}$ . Driver transistor Q1 is turned OFF when the PRE-CHG current is ON.

## DETAILED OPERATION AND APPLICATION INFORMATION

## A Simple Dual-Level Float-Cum-Boost Charger

Figure 3 shows the bq24450 configured as a simple dual-level float-cum-boost charger. Figure 4 shows the sequence of events that occur in a normal charge cycle. At (1) in Figure 4, power is switched ON. As long as the input voltage  $V_{IN}$  is below the undervoltage lockout threshold UVLO, Q2 is ON, disabling the driver transistor Q1. As the input voltage  $V_{IN}$  ramps up and rises above UVLO Q2 turns OFF. This enables Q1 and thus the external transistor  $Q_{EXT}$ . At the same time, Q7 turns ON, latch L1 is forced to RESET and latch L2 is SET (see Figure 1 for the internals of the Charging State Logic).

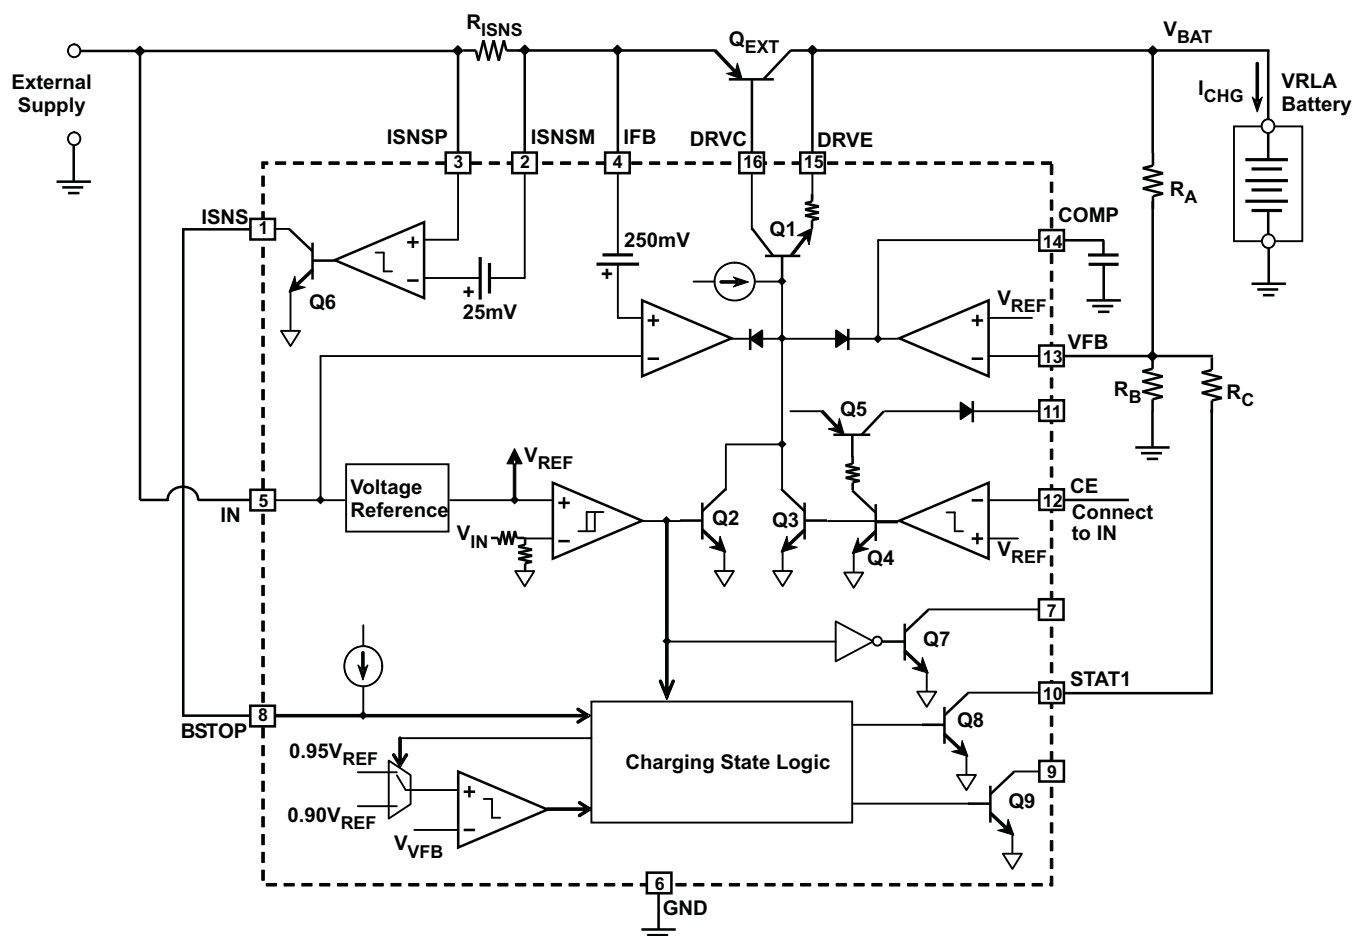

The voltage regulating amplifier tries to force the voltage at the VFB pin to  $V_{REF}$  by turning Q1 and thus Q<sub>EXT</sub> fully ON, but the current limiting amplifier limits the charging current  $I_{CHG}$  to  $I_{MAX-CHG}$  such that the voltage across  $R_{ISNS}$  is  $V_{ILIM} - 250mV$  typical. Thus  $I_{MAX-CHG}$  is given by:

$$I_{\text{MAX-CHG}} = V_{\text{ILIM}} \div R_{\text{ISNS}}$$

As  $I_{CHG}$  flows into the battery, the battery terminal voltage increases. The voltage at the VFB pin is the battery voltage scaled by the resistive divider formed by  $R_A$  and  $R_B/R_C$  (because Q8 is ON). At (3), the voltage on the VFB pin exceeds  $0.95V_{REF}$ , and the output of the voltage sense comparator goes HIGH. This forces L2 to RESET, and STAT2 turns ON. The battery voltage  $V_{BI}$  at this point when STAT2 indicates boost is given by:

$$V_{BI} = 0.95V_{REF} \times (R_A + R_B // R_C) \div R_B // R_C$$

Other than STAT2 changing state at this point, there is no externally observable change in the charging conditions.  $I_{MAX-CHG}$  continues to flow into the battery.

**Figure 3.**

As charging proceeds, the voltage at the VFB pin increases further to  $V_{REF}$ . At this point, the voltage regulating amplifier prevents the voltage at the VFB pin from rising further, maintaining the battery voltage at  $V_{BOOST}$ . [(4) in Figure 3].

$$V_{BOOST} = V_{REF} \times (R_A + R_B / R_C) \div R_B / R_C$$

$I_{CHG}$  keeps flowing into the battery. As the battery approaches full charge, the current into the battery decreases, while the battery terminal voltage is maintained at  $V_{BOOST}$ .

At (5), the charging current  $I_{CHG}$  reduces to a value  $I_{TAPER}$  such that the voltage across  $R_{ISNS}$  becomes less than  $V_{ISNS}$  (25mV typical)

$$I_{TAPER} = V_{ISNS} \div R_{ISNS}$$

Q6 at the output of the current sense comparator turns OFF. The internal current source pulls the BSTOP pin HIGH, latch L1 is forced to SET, in turn forcing L2 to SET. The reference voltage on the voltage sense comparator is now  $0.9V_{REF}$ . STAT1 turns OFF, and the voltage on the battery settles to:

$$V_{FLOAT} = V_{REF} \times (R_A + R_B) \div R_B$$

As long as the peak load current is less than  $I_{MAX-CHG}$ , it will be supplied by  $Q_{EXT}$ , and the voltage across the battery will be maintained at  $V_{FLOAT}$ . But if the peak load current exceeds  $I_{MAX-CHG}$ , the battery will have to provide the excess current, and the battery terminal voltage will drop. Once it drops below  $0.9V_{REF}$ , at (6) in Figure 3, a new charge cycle is initiated. The battery voltage  $V_{BAT}$  at this point,  $V_{RCH}$ , is given by:

$$V_{RCH} = 0.9V_{REF} \times (R_A + R_B) / R_B$$

Figure 4.

The problem with the charger circuit shown in [Figure 3](#) is that even with deeply discharged batteries, charging starts at full current level  $I_{MAX-CHG}$ . This can sometimes be hazardous, resulting in out-gassing from the battery. The bq24450 can be configured to pre-charge the battery till the voltage levels rise to levels safe enough to permit charging at  $I_{MAX-CHG}$ .

$$I_{\text{PRE}} = (V_{\text{IN}} - V_{\text{BAT}}) \div R_{\text{T}}$$
$$V_{TH} = V_{REF} \times (R_A + R_B + R_C // R_D) \div (R_B + R_C // R_D)$$

Figure 6.

### Further Improvements to the Circuit of Figure 5

In applications where the load current is very low, the current through the  $V_{BAT}$  voltage divider can be a non-negligible proportion of the load current. Current flowing back thorough  $Q_{EXT}$  when the input power is removed constitutes another drainage path. The modifications in Figure 7 fix both these issues.

The addition of  $D_{EXT}$  (see Figure 7) fixes the reverse current problem. Returning the voltage feedback divider chain to the PGOOD pin instead of to GND ensures that the divider does not draw any current when the input supply is not present. (When sinking  $50\mu A$ , the saturation voltage of the PGOOD transistor is typically only 30mV).

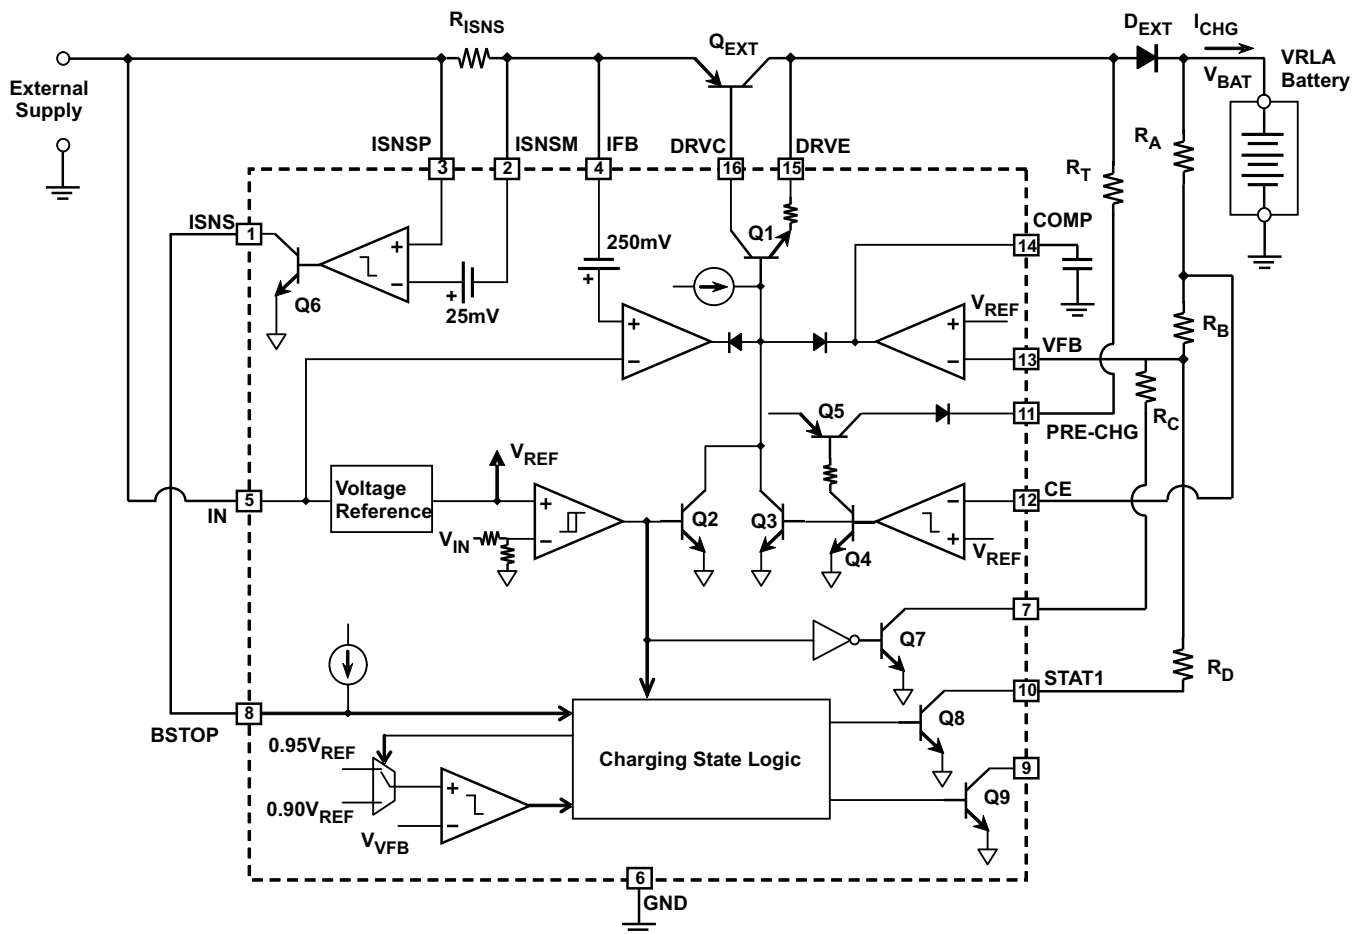

Figure 7.

### Changing the value of $I_{TAPER}$ for a given $I_{MAX-CHG}$

In the examples above,  $I_{TAPER}$  is 10% of  $I_{MAX-CHG}$ , because  $V_{ILIM}$  is 250mV and  $V_{ISNS}$  is 25mV (typical values), and the same resistor is used for both, the taper comparator and the current-loop amplifier. In most applications, setting  $I_{TAPER}$  to 10% of  $I_{MAX-CHG}$  is perfectly fine. But if, for some reason, a different value of  $I_{TAPER}$  is required, it can be achieved, as shown in Figure 8(a) and Figure 8(b).

Figure 8a

$$I_{MAX-CHG} = V_{ILIM} \div (R_{ISNS1} + R_{ISNS2})$$

$$I_{TAPER} = V_{ISNS} \div R_{ISNS2}$$

Figure 8b

$$I_{MAX-CHG} = V_{ILIM} \div R_{ISNS1}$$

$$I_{TAPER} = V_{ISNS} \div (R_{ISNS1} + R_{ISNS2})$$

Figure 8.

## Selecting the External Pass Transistor

All the examples so far have used a PNP transistor for the external pass element. But the driver transistor in the bq24450 can be configured to drive many different types of pass transistors. This section will look at some of the different configurations that are possible. In all configurations, though, these factors hold:

1. The external pass device must have sufficient voltage rating for the application, and must have the current and power handling capabilities to charge at the desired rate at the maximum input to output differential in the application.
2. The device must have enough current gain at the required charging current to keep the drive current below 25mA.

The choice of the pass device and the configuration of the internal driver transistor have an effect on the following:

1. The minimum and maximum practical charging current.
2. The open-loop gains of the current and voltage loops, and hence the value of the compensation capacitor at the COMP pin. In battery charging applications, dynamic response is not a requirement, and the values of  $C_{COMP}$  given below should give stable operation under all conditions.
3. The IC's power dissipation and thus its self-heating. The IC typically has a thermal resistance of 100°C/W. An external resistance  $R_P$  can be added to share some of the power dissipation and reduce the IC's self-heating.
4. The minimum differential voltage  $\Delta V$  (from the input to the battery) required to operate.

The next section addresses a few topologies, and gives values for the charge current range, the minimum input to output differential  $\Delta V$ , power dissipation  $P_D$  in the IC,  $R_P$  and  $C_{COMP}$  for each of the topologies. (In the expressions below,  $h_{FE}$  is the current gain of the external transistor).

### Common-Emitter PNP

$I_{MAX-CHG}$  range: 25mA to 1000mA

Minimum  $\Delta V$ : 0.5V

$$R_P = (V_{IN(MIN)} - 2.0V) \div I_{MAX-CHG} \times h_{FE(MIN)}$$

$$P_D = (V_{IN(MAX)} - 0.7V) \div h_{FE} \times I_{MAX-CHG} - (I_{MAX-CHG})^2 \div (h_{FE})^2 \times R_P$$

$$C_{COMP} = 0.1 \mu F$$

### PNP in a Quasi-Darlington With Internal Driver

$I_{MAX-CHG}$  range: 25mA to 1000mA

Minimum  $\Delta V$ : 2V

$$R_P = (V_{IN(MIN)} - V_{OUT(MAX)} - 1.2V) \div I_{MAX-CHG} \times h_{FE(MIN)}$$

$$P_D = (V_{IN(MAX)} - V_{OUT} - 0.7V) \div h_{FE} \times I_{MAX-CHG} - (I_{MAX-CHG})^2 \div (h_{FE})^2 \times R_P$$

$$C_{COMP} = 0.01 \mu F \text{ to } 0.047 \mu F$$

# bq24450

SLUS929A – APRIL 2009 – REVISED JANUARY 2010

www.ti.com

## External Quasi-Darlington

$I_{MAX-CHG}$  range: 0.6A to 15A

Minimum  $\Delta V$ : 1.2V

$$R_P = (V_{IN(MIN)} - 0.7 \text{ V}) \div I_{MAX-CHG} \times h_{FE1(MIN)} h_{FE2(MIN)}$$

$$P_D = (V_{IN(MAX)} - 0.7 \text{ V}) \div (h_{FE1} \times h_{FE2}) \times I_{MAX-CHG} - (I_{MAX-CHG})^2 \div (h_{FE1} \times h_{FE2})^2 \times R_P$$

$$C_{COMP} = 0.22 \mu\text{F} \text{ with } 470 \Omega \text{ series resistor to GND}$$

## NPN Emitter-Follower

$I_{MAX-CHG}$  range: 25mA to 1000mA

Minimum  $\Delta V$ : 2.7V

$$R_P = (V_{IN(MIN)} - V_{OUT(MAX)} - 1.2 \text{ V}) \div I_{MAX-CHG} \times h_{FE(MIN)}$$

$$P_D = (V_{IN(MAX)} - V_{OUT} - 0.7 \text{ V}) \div h_{FE} \times I_{MAX-CHG} - (I_{MAX-CHG})^2 \div (h_{FE})^2 \times R_P$$

$$C_{COMP} = 0.01 \mu\text{F} \text{ to } 0.047 \mu\text{F}$$

## DESIGN EXAMPLE

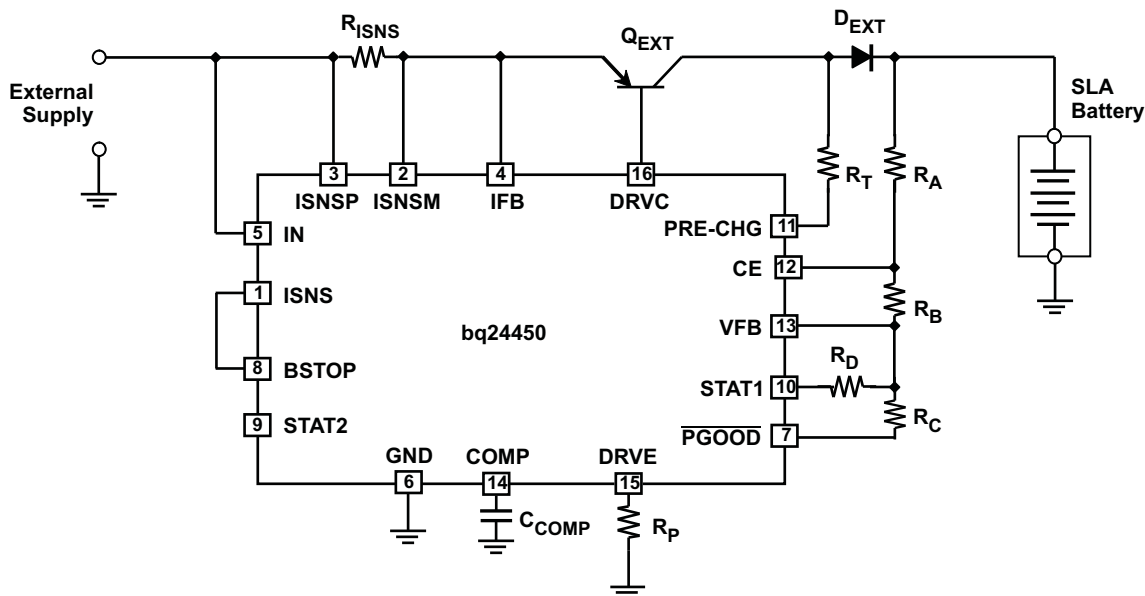

This section covers the design of a dual-level charger for a 6V 4Ah sealed lead-acid battery. The application is a system where the battery is used in standby mode, and the load on the battery when it powers the system is 250mA (0.06C).

The battery parameters are (see References 1 and 2)

Final discharge voltage	1.75V per cell	5.25V	$V_{TH}$
Float voltage	2.30V per cell	6.9V	$V_{FLOAT}$
Voltage in boost mode	2.45V per cell	7.35V	$V_{BOOST}$
Charge rate	0.05C to 0.3C	Use 0.15C = 600 mA	$I_{MAX-CHG}$
$V_{BAT(MIN)}$		4V	
Trickle charge rate		10 mA	

The charger is required to operate from a supply voltage of 9V to 13V. Therefore, the minimum input to output differential is 1.65V. To block reverse current from the battery to the input supply use a blocking diode as in Figure 7. This leaves only 0.65V as the differential across the external transistor, forcing the use of the Common-Emitter PNP topology.

Figure 9 is the schematic for this charger (from Figure 7, with the pass transistor topology changed), with the remaining task being the calculation of all the component values.

**Figure 9.**

The first step is to decide on the value of the current in the voltage divider resistor string in FLOAT mode. This should be substantially higher than the input bias current in the CE and VFB pins and the leakage current in the STAT1 pin, but low enough such that the voltage on the PGOOD pin does not introduce errors. A value of 50µA is suitable.

In FLOAT mode, STAT1 is OFF, so there is no current in R<sub>D</sub>. The voltage on the VFB pin (V<sub>REF</sub>) is 2.3V.

$R_C = 2.30V \div 50\mu A = 46k\Omega$ . The closest 1% value is 46.4kΩ.

$V_{FLOAT} = V_{REF} \times (R_A + R_B + R_C) \div R_C \rightarrow R_A + R_B = 2 \times R_C = 92.8k\Omega$ .

$V_{BOOST} = V_{REF} \times (R_A + R_B + R_C // R_D) \div R_C // R_D \rightarrow R_D = 474.3k\Omega$ . Pick the closest 1% value of 475kΩ.

$V_{TH} = V_{REF} \times (R_A + R_B + R_C // R_D) \div (R_B + R_C // R_D) \rightarrow R_B = 16.9k\Omega$ .

$R_A = 92.8k\Omega - R_B = 75.9k\Omega$ . The closest standard value is 75kΩ.

$I_{PRE} = (V_{IN} - V_{BAT}) \div R_T \rightarrow R_T = 500\Omega$ . Select 499Ω. At V<sub>IN(MAX)</sub>, I<sub>PRE</sub> = 16mA, which is safe.

$I_{MAX-CHG} = V_{ILIM} \div R_{ISNS} \rightarrow R_{ISNS} = 250mV \div 600mA = 0.417\Omega$ . The closest 1% value is 0.422Ω.

For Q<sub>EXT</sub>, the BD242 is suitable, and a 1N4001 will do for D<sub>EXT</sub>

$R_P = (V_{IN(MIN)} - 2.0V) \div I_{MAX-CHG} \times h_{FE(MIN)} = 7 \div 0.6 \times 25 = 291.6\Omega$ . Pick 294Ω from the standard values.

$P_D = (V_{IN(MAX)} - 0.7V) \div h_{FE} \times I_{MAX-CHG} - (I_{MAX-CHG})^2 \div (h_{FE})^2 \times R_P = 126mW$  under worst case conditions.

Choose C<sub>COMP</sub> = 0.1µF.

## REVISION HISTORY

NOTE: Page numbers of previous versions may differ from current version.

Changes from Original (April 2009) to Revision A	Page
• Deleted PDIP package option from Features .....	1
• Deleted PDIP package from Ordering Information table .....	2
• Changed equations to correct typo/formatting errors (3 equations) .....	8
• Changed equations to correct typo/formatting errors .....	9
• Changed equation to correct typo/formatting errors .....	10
• Changed three equations to correct typo/formatting errors .....	15
• Changed component values in "Design Example" calculations. ....	15

## PACKAGING INFORMATION

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
BQ24450DW	ACTIVE	SOIC	DW	16	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
BQ24450DWTR	ACTIVE	SOIC	DW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BQ24450DWTR	SOIC	DW	16	2000	330.0	16.4	10.85	10.8	2.7	12.0	16.0	Q1

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
BQ24450DWTR	SOIC	DW	16	2000	346.0	346.0	33.0

DW (R-PDSO-G16)

## PLASTIC SMALL-OUTLINE PACKAGE

4040000-2/F 06/2004

- NOTES: A. All linear dimensions are in inches (millimeters).  
B. This drawing is subject to change without notice.  
C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).  
D. Falls within JEDEC MS-013 variation AA.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
